ABSTRACT

The depth-duration frequency (DDF) and intensity-duration frequency (IDF) of annual maxima precipitation were computed for Tom Miller Dam, which is located on the Colorado River in Austin, Travis County, Texas. The computations were based on the data and procedures defined by Asquith (1998). The location of the dam was chosen because it is proximate to central Austin, central Travis County, and is geographically familiar to the general public. Within the implied uncertainties suggested by Asquith (1998), the computed DDF and IDF values are considered applicable for the City of Austin in particular and Travis County in general. The DDF and IDF values are reported in tables 1 and 2, respectively. The IDF values were derived by simple division of DDF values by the precipitation duration in hours.

The durations include 15 minutes, 30 minutes, 1 hour, 2 hours, 3 hours, 6 hours, 12 hours, 1 day, 2 days, 3 days, 5 days, and 7 days. The frequency levels include the annual nonexceedance probabilities (F) of 0.5, 0.6, 0.7, 0.8, 0.9, 0.96, 0.98, 0.99, 0.996, and 0.998. These probabilities permit smooth graphical construction of the upper tail ($F = 0.50$) of the precipitation distribution. The recurrence intervals (RI) commonly used include 2, 5, 10, 25, 50, 100, 250, and 500 years. The F account for the RI. The 2-year RI corresponds to the median, 50th percentile, or 0.5 nonexceedance probability. The relation between recurrence interval and nonexceedance probability is $RI=1/(1-F)$.

The distribution parameter values used in DDF computation provided by maps in Asquith (1998) were derived by computer algorithm using the latitude ($30^{\circ}17'42''$) and longitude ($97^{\circ}47'12''$) of Tom Miller Dam. The algorithm accuracy was manually verified. Small changes in the distribution parameters for the 7-day duration were made to insure that 7-day precipitation depths for the largest nonexceedance probabilities ($F = 0.90$) were larger than corresponding values for the 5-day duration. Upper tail convergence of the 5- and 7-day distributions appears likely.

Asquith (1998) defines separate durations of 60 minutes and 1 hour, which were derived from 15-minute data and hourly data, respectively, and separate durations of 24 hours and 1 day, which were derived from hourly and daily data, respectively. It was decided that the 60-minute and the 24-hour durations would not be used to define the DDF and IDF. This decision was based on the available record length and spatial distribution of 15-minute and hourly precipitation stations in the region surrounding the Austin area. Furthermore, a change in the distribution type from the Generalized Logistic to the Generalized Extreme Value occurs at the transition of 24 hours to 1 day.

August 7, 2019

The Zone 1 and Zone 2 depth-duration-frequency values provided in Section 2.3.1 are based on NOAA Atlas 14 – Volume 11 Version 2.0: Texas. The values were calculated by averaging each Atlas 14 precipitation-frequency grid over the Zone 1 and Zone 2 jurisdictional areas.

The Zone 1 and Zone 2 areas are defined by splitting the City of Austin's full purpose jurisdiction and ETJ at the Colorado River, with one exception as described below and shown in Figure 2-2. Zone 1 includes all portions of the City's jurisdiction and 2- and 5-mile ETJ located south of the Colorado River except for the area located between Murfin Road and Lake Travis. Zone 2 includes all portions of the City's jurisdiction and 2- and 5-mile ETJ located north of the Colorado River and the area located between Murfin Road and Lake Travis.

The procedure used to develop the Atlas 14-based rainfall data is documented in detail in Freese and Nichols' August 2019 memo, *Atlas 14 DCM Revisions: Area Breakdown and IDF Curves* and in Watearth's August 2019 memo, *City of Austin Drainage Criteria Manual (DCM) Updates: Rainfall Distribution Evaluation*.

The City of Austin has adopted the use of a 24-hour HEC-HMS frequency storm distribution for use with time-varying rainfall simulations. For HEC-HMS model runs, these depths should be entered directly into HEC-HMS frequency storm meteorologic models. For other dynamic hydrologic modeling software, or for spreadsheet calculations, the cumulative 24-hour rainfall time series derived from HEC-HMS for the 2-, 10-, 25-, and 100-year recurrence interval storms can be downloaded as a comma-separated values (CSV) file below.

DRAINAGE CRITERIA MANUAL

NEW APPENDIX F. - Rainfall Criteria Pre-Dating Atlas 14

Appendix F

Rainfall Criteria Pre-Dating Atlas 14

The rainfall criteria in this Appendix is to be used to calculate the 100-year floodplain, 25-year floodplain, Base Flood, Design Flood, Flood Hazard Area, and Floodway for areas not yet amended to incorporate Atlas 14 data.

The DDF (depth-duration-frequency) and IDF (intensity-duration-frequency) values are shown in Table F-1 and Table F-2. The Austin intensity-duration-frequency curves are shown in Figure 2-2 in Appendix D of this manual.

<u>250</u>	<u>14.5</u>	<u>10.9</u>	<u>7.14</u>	<u>5.26</u>	<u>3.43</u>	<u>2.46</u>	<u>1.37</u>	<u>0.806</u>	<u>0.501</u>
<u>500</u>	<u>15.9</u>	<u>12.4</u>	<u>8.04</u>	<u>6.06</u>	<u>3.97</u>	<u>2.84</u>	<u>1.58</u>	<u>0.934</u>	<u>0.564</u>

* The 5-min rainfall intensity values were calculated using Equation F-1 and the coefficients listed in Table F-3 for the return periods of 2, 5, 10, 25, 100, 250, and 500 years.

The following equation mathematically represents the Austin area intensity-duration-frequency curves:

$$i = a/(t+b) c \text{ (Eq. F-1)}$$

Where,

i = Average rainfall intensity, inches per hour

t = Storm duration in minutes, which is equal to the time of concentration for the entire drainage area of interest

a, b and c = Coefficients for different storm frequencies.

The final best-fit coefficients of a, b, and c for equation (F-1) are listed in Table F-3 below:

<u>Table F-3</u> <u>Austin Intensity-Duration-Frequency Curve Coefficients</u>			
<u>Return Period</u>	<u>Fitting parameters for IDF equation (2-8)</u>		
<u>Year</u>	<u>a</u>	<u>b</u>	<u>c</u>
<u>2</u>	<u>54.767</u>	<u>11.051</u>	<u>0.8116</u>
<u>5</u>	<u>62.981</u>	<u>10.477</u>	<u>0.7820</u>
<u>10</u>	<u>70.820</u>	<u>10.396</u>	<u>0.7725</u>

Source: Asquith, W.H., "Depth-Duration Frequency and Intensity-Duration Frequency for Austin and Travis County, Texas, 2001".

Table F-4 below provides the Type III distribution ordinates in 5-minute increments as derived from the HEC-HMS program. The ordinates should be multiplied by the total 24 hour precipitation depth to produce the design rainfall distribution. When using the HEC-HMS model, the computational time interval should be selected based on criteria for the minimum lag time. The maximum computational time interval used in a HEC-HMS model should be 6 minutes.

Table F-4
